files for the Unofficial Skyrim Legendary Edition.Heiziegel The Heiziegel (, meaning "heating glass") is a device for heating and cooking food, usually by using hot air from a gas oven, in the early 20th century. It was introduced by Bertha-Marie Coeler in the winter of 1911 in Switzerland. In Switzerland the Heiziegel was the first electrically heated and stored energy device. In the 1930s, Heiziegel-Plattformen were sold in a series of German households. References: Category:Cooking appliancesThe present invention relates to a method of forming a patterned photo sensitive resin layer, and more particularly to a method of forming a patterned photo sensitive resin layer having an improved resolving power and the ability of forming fine patterns, as well as a method of manufacturing a solid-state image sensor, which may prevent light from penetrating into a semiconductor chip through the patterned photo sensitive resin layer and thus prevent generation of dark signals and obtain high quality images. Recently, the number of pixels per unit area of solid-state image sensors is increasing. For instance, there is a demand for a solid-state image sensor having 1000x1000 pixels, preferably 1200x1200 pixels and further having 2000x2000 pixels or more. In view of these demands, the ability to form a micro pattern on a solid-state image sensor chip having a large number of pixels has become important. In a process of manufacturing a solid-state image sensor, a photo sensitive resin layer is formed over an entire surface of a semiconductor wafer and is patterned to form pixels and a micro circuit by a photolithography technique. A photoresist layer is applied to the patterned photo sensitive resin layer to form a mask pattern thereon, and then a portion of the photo sensitive resin layer is exposed to light using the mask pattern. A developer is applied to the exposed photo sensitive resin layer to remove the exposed portions of the photo sensitive resin layer and thereby form a patterned photo sensitive resin layer having the mask pattern. The mask pattern formed on the patterned photo sensitive resin layer serves as a light shielding mask for blocking incident light when a light sensitive element is formed. In other words, the patterned photo sensitive resin layer serves as a base for the light sensitive element. However, because light may penetrate through the photo sensitive resin layer, a portion of the photo sensitive resin layer not shielded by the mask pattern may 82157476af
